DevOps Engineer – CI/CD & Environments

Team: Platform Engineering
Level: L3 (Junior)
Type: Full-time
Start: Immediate
Location: Abu Dhabi, UAE

About the role

We are building an enterprise AI platform in which AI agents operate business applications through their user interface, the way a person does. It runs on **Kubernetes** across Microsoft Azure, on-premises, and air-gapped environments, delivered through **GitOps**. We are a small team working in two-week sprints towards a first production release in December 2026.

You will keep the engineering team shipping: building and maintaining CI/CD pipelines, setting up and looking after environments, and keeping monitoring and runbooks up to date. You will work closely with, and learn from, our DevOps Engineer – Platform & AI Infrastructure.

What you will do

- Build and maintain **CI pipelines** (GitHub Actions or Azure DevOps): build, test, scan, and publish container images and Helm charts.
- Set up and maintain development, test, and staging environments on Kubernetes through **GitOps** (Argo CD or Flux).
- Maintain Helm charts and Kubernetes manifests as the platform changes.
- Build and maintain monitoring dashboards and alerts (Prometheus, Grafana, Loki).
- Support the fleet of sandboxed browsers the AI agents use: capacity, health checks, and clean-up.
- Write and keep runbooks up to date, and help the team with build, deployment, and environment issues.
- Take part in incident response, guided by the senior engineer.

What we are looking for

Must have

- 2+ years of experience in DevOps, SRE, infrastructure, or software engineering.
- Comfortable with **Linux**, **Docker**, and **Git**.
- Working knowledge of **Kubernetes**: deployments, services, config maps, secrets, and kubectl.
- Experience building or maintaining **CI/CD pipelines**.
- Scripting in **Bash** and/or **Python**.
- Eager to learn, careful with production systems, and good at asking for help early.

Nice to have

- Helm, Argo CD, or Flux.
- Terraform / OpenTofu.
- Azure fundamentals (AZ-900 or AZ-104) or CKAD.
- Prometheus and Grafana.
- Exposure to GPU workloads or headless browsers (Chromium, Playwright).

What we will assess

- **Technical exercise:** containerise a small service and write a CI pipeline that builds, tests, and publishes it.
- **Troubleshooting:** work out why a deployment on Kubernetes is failing.
- **Learning and collaboration:** how you learn new tools and work with a senior engineer.

Why join

- Learn modern platform engineering (Kubernetes, GitOps, GPUs, air-gapped delivery) from a senior engineer, on a real production platform.
- See the direct impact of your work on how fast the whole team ships.
- Grow with a new team from the start.
